To whom it may concern,

I was 13 years old when I first opened a computer. It was right there, in that moment, when I realized that's what I wanted to do for the rest of my life. At 14 I started learning HTML, CSS and Javascript all by myself and, because of that, I could develop my first website at that age. It was magical, I felt like I could create anything and go anywhere through that tiny machine, like it was a portal to a whole new world full of possibilities.

After that, I was hooked. At High School, I went to a technical school and learned more about web development and realized that there was a path for me to follow and that I could actually be good at it. A few years later, at College, I first encountered this huge group of people that wanted to learn more about the same things I did, and this opportunity launched me to an entire new level. It was at College that I really learned how to study, how to acquire knowledge and how to create new ideas.

It was also there that I had to face a very difficult choice: what computer area to follow. You see, it was and still is such a hard thing to choose because everything I continuously learn at University and everything I learn today because of the opportunities that being there brought me still feel magical, like when I was a child. When I'm developing new projects like games, mobile applications and websites, I still feel that thrill of new possibilities opening up right in front of me. I know that I don't have all the tools to make that choice yet, but I hope to find them through all the opportunities that Planck gave me, along with scientific initiation; and I hope that with all those new tools next to me, I can find my future full of opportunities and dreams, like the one I once glanced at when I first opened a computer.

Yours sincerely,

Marcos Ani Cury Vinagre Silva
